# RUBBER WIRING AND BLANKING GROMMETS

Rubber wiring grommets are essential components used to protect and manage cables as they pass through panels, enclosures, and metal surfaces. Designed to line cut-outs and drilled holes, they prevent sharp edges from damaging cable insulation and reduce the risk of abrasion, electrical faults, and premature failure.

Suitable for electrical, automotive, and industrial applications, rubber wiring grommets offer a simple and cost-effective solution for improving cable longevity, safety, and overall installation quality.

Rubber blanking grommets are designed to seal and protect unused or redundant holes in panels, enclosures, and equipment. Installed as a tight push-fit, they provide an effective barrier against dust, moisture, and environmental contaminants while delivering a clean, finished appearance.

Commonly used across electrical, automotive, and manufacturing applications, blanking grommets also help maintain enclosure integrity and can assist in reducing noise, vibration, and pressure loss in sealed systems.
